

Supplementary Material: Prototype User Interface

A Secure and Auditable Framework for Legal Data Management: A Hybrid Approach Using Hyperledger Fabric and IPFS

This supplement collects the prototype interface screenshots referenced in the main text (Section “User Interface and Functional Showcase”). The audit and transparency views (ledger explorer and audit log) appear in the main text; the remaining screens are shown here.

The registration screen (Fig. 1a) collects a username, email address, password, and role selection before account creation. The dashboard (Fig. 1b) is the landing page, presenting the primary navigation cards for case work, documents, communication, and audit-oriented tasks. The case-management view (Fig. 1c) displays active matters as cards with case titles, client names, status labels, short descriptions, and a control for creating a new case.

The document views show the information exposed after a file is selected. The document-details dialog (Fig. 1d) lists the file name, associated case, owner, content identifier, transaction identifier, integrity hash, and available actions. The download dialog (Fig. 2a) shows the selected file, access status, wrapped-key reference, encrypted-file reference, password prompt, and separate controls for downloading the encrypted object or saving the decrypted copy.
